Net neutrality isn't good for consumers

Dumb is better. That is what the advocates of so-called net neutrality would have us believe. Their basic belief is that broadband networks should be dumb pipes that indifferently pass packets of information from one location to another, allowing the content providers and consumers at the ends of the network equal opportunity to do whatever they want. Who could be against that? Well, maybe people who are interested in innovation and customer welfare.

Consider what would happen if the Internet were dumb. The Internet is a rich tapestry of information that interconnects people from around the world. It is not a dumb pipe. It is a system that allows for innovation and creativity in a way that is not possible with dumb pipes. The Internet is a network that is constantly evolving and changing, allowing for new technologies and services to be developed and made available to consumers. It is a network that is designed to be open and accessible to all, allowing for free and fair competition among content providers. It is a network that is built on a foundation of democratic principles, with no one having more power or influence than anyone else.
